

**Abnormal Findings:** None.

## EYE Phenotype

### Cornea:

**6/6.** Normal corneal epithelium, stroma, and endothelium. There is some tissue overlying the epithelium - likely an artifact of the dissection.

### Anterior chamber:

**6/6.** The anterior chamber was of normal depth without cells, and the angle appeared open.

### Iris:

**6/6.** The iris showed normal pigmentation without rubeosis or pupillary membranes.

**Lens:**

**6/6.** No cataract was observed.

**Ciliary body:**

**6/6.** Normal stroma, pigmented and nonpigmented layers were present along with cilia.

**Vitreous:**

**6/6.** No abnormal cells. This section shows a few eosinophilic opacities, but this was not seen in other eyes.

**Retina:**

**6/6.** The retinal ganglion, inner nuclear and photoreceptor layers are normal.

**Retinal pigment epithelium and Choroid:**

**6/6.** Normal pigmentation. Bruch's membrane is intact. No neovascular membranes were noted.

**Optic Nerve:**

**6/6.** The nerve is normal.

**Methods.** 6 eyes from 3 male mice were enucleated by blunt dissection and fixed. Pupil-optic nerve sections were processed with hematoxylin and eosin, and standard images were captured under light microscopy for review.
