

## Weight Curves

-----

Mice of both sexes were weighed at regular intervals. The actual ages and number of measurements differed slightly between pipelines:

Pipeline 1: regular intervals between 4-15 weeks of age.

Pipeline 2: weekly between 9-14 weeks of age.

Mouse GP: regular intervals between 4-16 weeks of age.

MGP Select: regular intervals between 4-16 weeks of age.

In most instances the weight was taken as a 5 second average when the mice was placed on the scale. The diet the mice were on was pipeline dependant.
